Location Chişinău, Moldova **Languages** RO · FR · RU · EN

PROFILE

Backend-leaning full-stack developer with six years of commercial experience, currently building event-driven microservices for a business-communications platform. Designed and delivered its real-time chat service end to end — Symfony and MongoDB behind a RabbitMQ / Socket.IO event pipeline — and owns several standalone services alongside it. Comfortable from schema design and broker topology through to the interface on top. Earlier background in payment processing. Four working languages.

EXPERIENCE

Backend / Full-Stack Developer — NIXAP Development SRL 2024 — present

Vylo — business-communications platform Dec 2025 — present

VoIP, SMS, team chat, video conferencing, call-centre CRM.

- **Built the chat service from an empty repository** — Symfony 7.4 / API Platform on MongoDB, with Elasticsearch full-text search and S3-compatible attachments served behind an authorising proxy route.
- **Designed the event pipeline behind it** — Symfony publishes to RabbitMQ, a Node.js + Socket.IO server consumes and broadcasts, Redis scales it across instances.
- **Task-management microservice** — with a deny-by-default permission model implemented as Symfony voters.
- **Contacts microservice** — extracted from the monolithic API, with identifier-based service boundaries instead of cross-service foreign keys.
- **Notification service** — user- and company-targeted events, delivered in real time over RabbitMQ.
- **Voice-agents service** — TypeScript / Express, provisioning AI voice agents on ElevenLabs and Deepgram, writing provider-first so local records never drift.
- Contributions to the core API (Stripe subscriptions, phone numbers, telecom integrations), a transcription API, a PostGIS geolocation service and the Electron/React desktop client.

Symfony 7.4 API Platform PHP 8.4 MongoDB RabbitMQ Socket.IO Elasticsearch Redis Node.js TypeScript
MinIO / S3 Docker JWT

Ride-hailing platform 2024 — 2025

Application for the Romanian market.

- Maintained and extended the platform across backend and frontend.
- Designed database structures and authored migrations for an evolving production schema.
- Shipped driver-passenger blocking, in-app messaging, real-time updates and multilingual interface support; built custom Vue.js components for in-app data visualisation.

Symfony Laravel Vue.js MySQL Redis Docker

PHP / Full-Stack Developer — ServiciiComplete 2022 — 2024

- Designed and implemented user registration and account flows.
- Modelled and managed order, transaction and delivery data in MySQL.
- Led a bespoke WordPress project from client requirements through to launch.

PHP JavaScript MySQL WordPress

- Developed and maintained payment-processing systems.
- Integrated third-party payment-gateway APIs.
- Worked with cross-functional teams on secure, scalable delivery.

PHP

JavaScript

Payment gateways

WordPress

- Built a time-tracking application for client projects: clients purchased development hours, developers logged usage against them for feature work and bug fixing.
- Earlier project work for OK Flora — internal administrative sites, user and transaction management.

MySQL

France — Hospitality industry

2006 — 2019

Worked full-time in hotels in France while saving to finance a return to software development. Retrained in 2019 through an intensive, state-funded programme and re-entered the field as a developer. Source of fluent French.
